UTM TAXONOMY — BR PROPOSAL

Date May 28, 2026 Author Darwin Godoy Status Proposal — for alignment GA4 Property 512299072 · New Brazil All Prod

01 · CONTEXT

BetWarrior BR's budget is structured around **6 acquisition channels**: Performance, Affiliates, Influencers, Brand & Media, Organic, and Direct. The current UTM taxonomy — built for Argentina's media mix — does not expose this structure in GA4. As a result, channel-level reporting requires manual source mapping outside the analytics tool, creating inconsistency and blind spots.

This document proposes a taxonomy adjustment that preserves Juanca's campaign naming conventions while adding a **channel layer** that aligns GA4 data directly with the BR budget distribution.

kwai	paid_media	BR_kwai_aon_conv_adquisicion_generica	Apuestas_int_search_generico_BR	Perfo
taboola	paid_media / referral *	BR_taboola_aon_conv_casino_native_mob	generic_native_aviator1	Perfo
deportes / casino	affiliate	conv_direct	reg_deportes / reg_casino	Affiliates
(not set)	affiliate	Site	casino	Affiliates
publisher	social_paid	esports	nfa	Influencers?
sofascore	branding	branding_aon_nacional_sofascore_conv_apuestas	branding_aon_3rd-party_ban_320x50_...	Brand?
google	organic	(organic)	—	Organic
(direct)	(none)	(direct)	—	Direct

* Same channel, different values — splits data across rows in GA4 ** Inconsistent casing observed: BR_meta vs br_meta

P1 Medium is not a reliable channel signal

Google campaigns appear under both `cpc` (auto-tagged) and `paid_media` (manual), splitting the same channel into two rows. Taboola appears as `paid_media` and `referral`. No single filter isolates "all paid media."

P2 Affiliates carry no partner identity

Source values are product categories (`deportes` , `casino`) instead of affiliate names. It is impossible to break down affiliate performance by partner in GA4 without cross-referencing MyAffiliates separately.

P3 Influencers are invisible or misclassified

`publisher / social_paid` identifies some influencer traffic but hides the influencer name. Influencer creatives (e.g., `int_imagen_tourinho`) appear inside Meta paid campaigns, indistinguishable from performance ads.

P4 Brand & Media has no unified tag

Sofascore uses `branding` as medium. No standard exists for other sponsorships, display awareness, or third-party publishers. Each partner invents their own pattern.

P5 Channel-level reporting requires manual assembly

There is no GA4 dimension that maps directly to the BR budget channels. Every report requires a lookup table to group sources into channels — error-prone and not scalable as the channel mix grows.

03 · PROPOSED TAXONOMY

The core change: **utm_medium becomes the channel identifier**, matching BR's budget distribution categories. Each medium value maps 1:1 to a budget line. utm_source retains its role as the platform or partner name. Campaign and content naming conventions remain largely unchanged.

04 · WHAT CHANGES

BEFORE	AFTER
GA4 filter for "Affiliates" Must manually include: <code>deportes</code>, <code>casino</code>, <code>retargeting</code>, <code>(not set)</code> where medium = affiliate Google traffic Appears as <code>google/cpc</code> AND <code>search/paid_media</code> AND <code>pmax/paid_media</code> — 3 rows for the same channel Influencer identity Hidden inside creative name (<code>int_imagen_tourinho</code>) or lumped as <code>publisher/social_paid</code> Channel report Requires manual source-to-channel mapping table, rebuilt every time a new partner is added	GA4 filter for "Affiliates" Single filter: <code>medium = affiliates</code> — all partners included automatically Google traffic Single row: <code>source = google, medium = perfo</code> — auto-tag conflict resolved via GA4 data import or manual override Influencer identity Visible at source level: <code>source = tourinho, medium = influencer</code> Channel report Native GA4 segment by medium — no mapping table needed, new partners automatically classified

Operational impact by team:

ACTION	OWNER	SCOPE	TIMING
Redefine <code>utm_medium</code> values in campaign templates	Perfo ARG	All active BR campaigns on Google, Meta, X, TikTok, Kwai, Taboola	New campaigns
Update affiliate tracking links in MyAffiliates — source = partner name	Darwin + Afil.	All active affiliate partners	Phased
Create UTM link generator for influencer campaigns	Darwin	All active influencers (Tourinho, Hulk, Braga...)	Immediate
Resolve Google auto-tagging conflict (gclid overrides <code>utm_medium</code>)	Perfo ARG	Google Ads — configure data import or enable manual tagging priority	New campaigns
Update GA4 channel grouping rules to match new medium values	Perfo ARG	GA4 Admin → Data Streams → Channel Groups	New campaigns
Archive historical data note — old sessions retain old medium values	Darwin	Document cutover date; do not backfill	On cutover

Historical continuity: Sessions before the cutover date will retain current medium values. GA4 comparisons across the boundary must account for the taxonomy change.
Recommended: define a clean cutover date (e.g., June 1) and document it.

05 · NEXT STEPS

- 1

Align on medium vocabulary
Confirm the 6 medium values (perfo, affiliates, influencer, brand, organic, direct) cover all BR acquisition channels. Juanca to flag any ARG-side conflicts.

Meeting
- 2

Define cutover date
All new campaigns launched after the cutover date use the new taxonomy. Recommend June 1 to align with a clean monthly boundary.

Meeting
- 3

Juanca updates campaign templates for BR
Update utm_medium in all active BR campaign templates across Google, Meta, X, TikTok, Kwai, and Taboola. Apply only to new campaigns going forward.

Perfo ARG
- 4

Darwin creates influencer link kit
Build a simple UTM link generator (spreadsheet or tool) for influencer campaigns. One tagged URL per influencer per activation. Distribute before next influencer goes live.
