

CHANNEL ATTRIBUTION · UTM STANDARDIZATION

UTM TAXONOMY PROPOSAL

A structured UTM framework aligned to BetWarrior Brazil's six budget channels enabling accurate attribution, consistent reporting, and scalable tracking across all paid and organic media.

UTM

1 CONTEXT

WHY WE NEED A NEW FRAMEWORK

BetWarrior Brazil operates with six budget channels Performance, Affiliates, Influencers, Brand & Mídia, Organic, and Direct each with distinct investment levels, CPA targets, and optimization logic. Our current UTM structure was inherited from the Argentine operation and does not map to these channels, making it impossible to attribute GA4 sessions and conversions to the right budget line.

SOURCE/MEDIUM COMBOS IN GA4

484

May 1–21, 2026 without a naming standard

STRUCTURAL PROBLEMS IDENTIFIED

5

blocking reliable channel attribution

BUDGET CHANNELS TO MAP

6

Perfo · Afil · Inflü · Brand · Org · Direct

2 CURRENT STATE

FIVE STRUCTURAL PROBLEMS

1 Argentine taxonomy applied to Brazil

Campaigns tagged for the AR market appear in BR reports without differentiation. No country dimension exists in the current UTM structure.

utm_source=google · utm_medium=cpc (both countries)

2 Influencers and affiliates unmapped

These two channels represent ~20% of BR budget but appear as generic sources in GA4 "link", "bio", or simply (not set). No reliable FTD measurement.

utm_source=link · utm_medium=(not set)

3 Naming inconsistency

The same channel appears under different capitalizations and spellings, fragmenting sessions in GA4 and making aggregation unreliable.

Google / google / Google_Ads / google-ads

4 Brand and paid media mixed

Brand campaigns (TV, OOH, sponsorships) share utm_source values with paid digital, making it impossible to isolate brand investment impact from direct response.

utm_source=meta · (brand video + perf ad)

5 No campaign naming convention

Campaign names are free-form across teams. The same product/audience combination has dozens of variations, blocking automated reporting.

br_maio_ftd / BRmayFTD / brasil-may-acquisition

PROPOSED TAXONOMY

PARAMETER

STRUCTURE

The framework uses four mandatory parameters and one optional. Every paid source must be tagged before going live. The **utm_source** is the primary mapping point it determines which budget channel the session belongs to in GA4 and in the pacing dashboard.

PARAMETER	PURPOSE	REQ.	EXAMPLE VALUES
utm_source	Maps to budget channel identifies origin	Mandatory	google, meta, nfa, betano, gil_br
utm_medium	Identifies buying model or content format	Mandatory	cpc, cpm, cpa, referral, influencer
utm_campaign	Identifies campaign with structured naming	Mandatory	br_perfo_ftd_google_may26
utm_content	Identifies creative or ad variant	Recommended	video_30s_v1, banner_300x250
utm_term	Keyword (search) or audience segment	Optional	betwarrior, apostas_esportivas

CAMPAIGN NAMING CONVENTION

All paid campaigns follow the pattern: **[country]_[channel]_[objective]_[source]_[period]**

• br_perfo_ftd_google_may26

• br_influ_awareness_gil_may26

• br_afil_ftd_nfa_may26

CHANNEL

MAPPING

BUDGET CHANNEL	UTM_SOURCE VALUES	UTM_MEDIUM	OWNER
Performance	google, meta, tiktok, apple, taboola, verve	cpc, cpm, cpv	Juanca
Affiliates	nfa, betano, sportingbet, <i>[affiliate_id]</i>	cpa, referral	Darwin
Influencers	<i>[influencer_handle]</i> (e.g. gil_br, braga)	influencer	Darwin
Brand & Mídia	tv_globo, band, espn, ooh, <i>[sponsor]</i>	brand, sponsorship, display	Darwin
Organic	google (via Search Console)	organic	SEO / auto-tagged
Direct	(direct)	(none)	Auto-detected GA4

4

WHAT CHANGES

BEFORE & AFTER

Concrete examples of how current UTM strings will be restructured. The goal is human-readable, machine-parseable tags that link every session to a budget channel without ambiguity. No historical data is touched the new taxonomy applies to campaigns going live from the agreed date forward.

CURRENT PERFORMANCE (BROKEN)	PROPOSED PERFORMANCE (STANDARDIZED)
utm_source=Google_Ads utm_medium=CPC utm_campaign=BRmayFTD	utm_source=google utm_medium=cpc utm_campaign=br_perfo_ftd_google_may26
CURRENT INFLUENCER (MISSING SOURCE)	PROPOSED INFLUENCER (TAGGED)
utm_source=link utm_medium=(not set) utm_campaign=(not set)	utm_source=gil_br utm_medium=influencer utm_campaign=br_influ_awareness_gil_may26
CURRENT AFFILIATE (UNTRACKED)	PROPOSED AFFILIATE (MAPPED)
utm_source=(direct) utm_medium=(none) utm_campaign=(not set)	utm_source=nfa utm_medium=cpa utm_campaign=br_afil_ftd_nfa_may26

BUSINESS IMPACT

AREA	CURRENT STATUS	AFTER IMPLEMENTATION
FTD Attribution	~40% unattributed or misattributed	Full channel-level FTD breakdown in GA4 matching budget structure
CPA by Channel	Only calculable for Performance (Google/Meta)	CPA for all 6 channels including Influencers and Affiliates
Pacing Dashboard	Shows spend but not FTD results by channel	Spend × FTD × CPA per channel in real time
Weekly Reporting	Manual reconciliation across GA4, PowerBI, spreadsheets	Automated channel groups in GA4 single source of truth
A/B Testing	Campaign-level only; creative splits invisible in GA4	Creative-level via utm_content; audience splits via utm_term

5 NEXT STEPS

IMPLEMENTATION PLAN

Four steps to full implementation. Weeks 1–2 cover alignment and documentation; weeks 3–4 cover rollout and validation. No historical data needs to be touched.

- 1

Align taxonomy with Juanca

Review this document together. Confirm utm_source values for each channel, particularly affiliate IDs and influencer handles. Agree on campaign naming convention and enforcement by owner (Juanca for Performance, Darwin for Affiliates, Influencers and Brand).

Week of May 27 meeting with Juanca (BR visit)
- 2

Publish UTM guide and URL builder

Create a shared Google Sheet with a URL builder and a reference tab listing all approved source/medium/campaign values per channel. Mandatory for all new campaigns from June onward.

Week of June 2
- 3

Configure GA4 Channel Groups

Create a custom channel grouping in GA4 that maps standardized utm_source values to the 6 budget channels. This enables the Pacing Dashboard to pull channel-level FTDs from GA4 without manual reconciliation.

Week of June 2 Darwin + data team
- 4

Retroactive audit and migration

Identify active campaigns still using old UTM strings. Prioritize high-spend first (Performance, Affiliates). Update tracking links in platform ad managers. Flag any campaigns that cannot be migrated mid-flight for the next cycle.

June: Juanca (Perfo) + Darwin (Affiliates, Influencers, Brand)

SUGGESTED ROLLOUT: START WITH PERFORMANCE ONLY

To de-risk the rollout, we propose starting with Performance campaigns: Google, Meta, TikTok, Taboola, Verve. This covers the largest budget channel (~30% of total spend). Affiliates, Influencers and Brand follow in week 2 of June, coordinated by Darwin.

WHAT WE ARE NOT CHANGING

- PowerBI tracking (separate from UTM)
- Affiliate platform tagging (MyAffiliates) UTM is supplemental
- Historical data applies to new campaigns only
- GA4 property / event configuration

OWNER BY CHANNEL

- Performance: Juanca
- Affiliates: Darwin
- Influencers: Darwin
- Brand & Mídia: Darwin
- Organic auto-tagged (no action needed)
- Direct auto-detected (no action needed)
